(Dated: 8 November 2019)

^{a)}Present address: Faculté des sciences, Institute of Condensed Matter and Nanosciences, Louvain la Neuve, Belgium

^{b)}Present address: Grupo de Espectroscopia Molecular, Universidad de Valladolid, Spain

^{c)}Electronic mail: arnaud.cuisset@univ-littoral.fr

I. SUPPLEMENTARY FIGURES

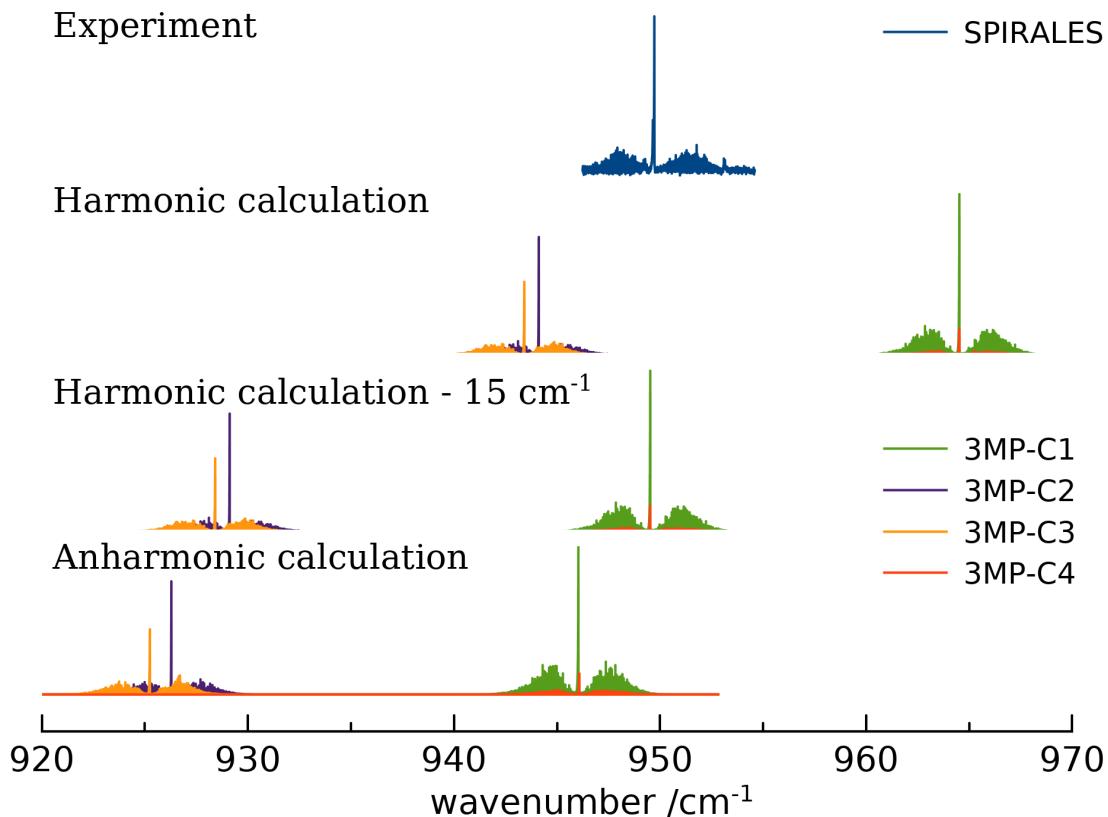

FIG. S1: SPIRALES spectrum of 3MP in the ν_{18} band region and comparison with simulations from the harmonic, shifted harmonic, and anharmonic calculations. The relative abundances are taken into account and the predicted (harmonic) intensities of 3MP-C1 is used for all conformers.

The shifted harmonic simulation (rather than a conventional scaling) serves as visual aid to identify experimental spacing between conformers and compare it in the experiment and calculation.

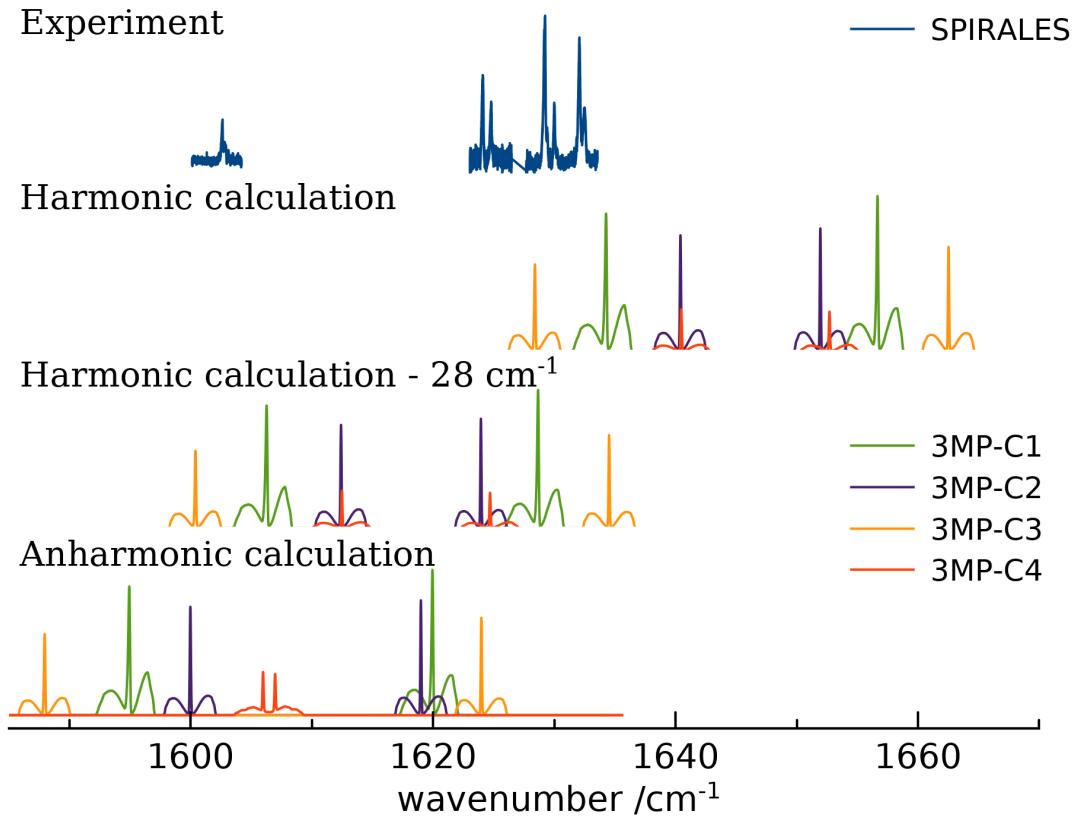

FIG. S2: SPIRALES spectrum of 3MP in the v_{36} and v_{37} bands region and comparison with simulations from the harmonic, shifted harmonic, and anharmonic calculations. The relative abundances are taken into account and the predicted (harmonic) intensities of 3MP-C1 is used for all conformers. The shifted harmonic simulation (rather than a conventional scaling) serves as visual aid to identify experimental spacing between conformers and compare it in the experiment and calculation.

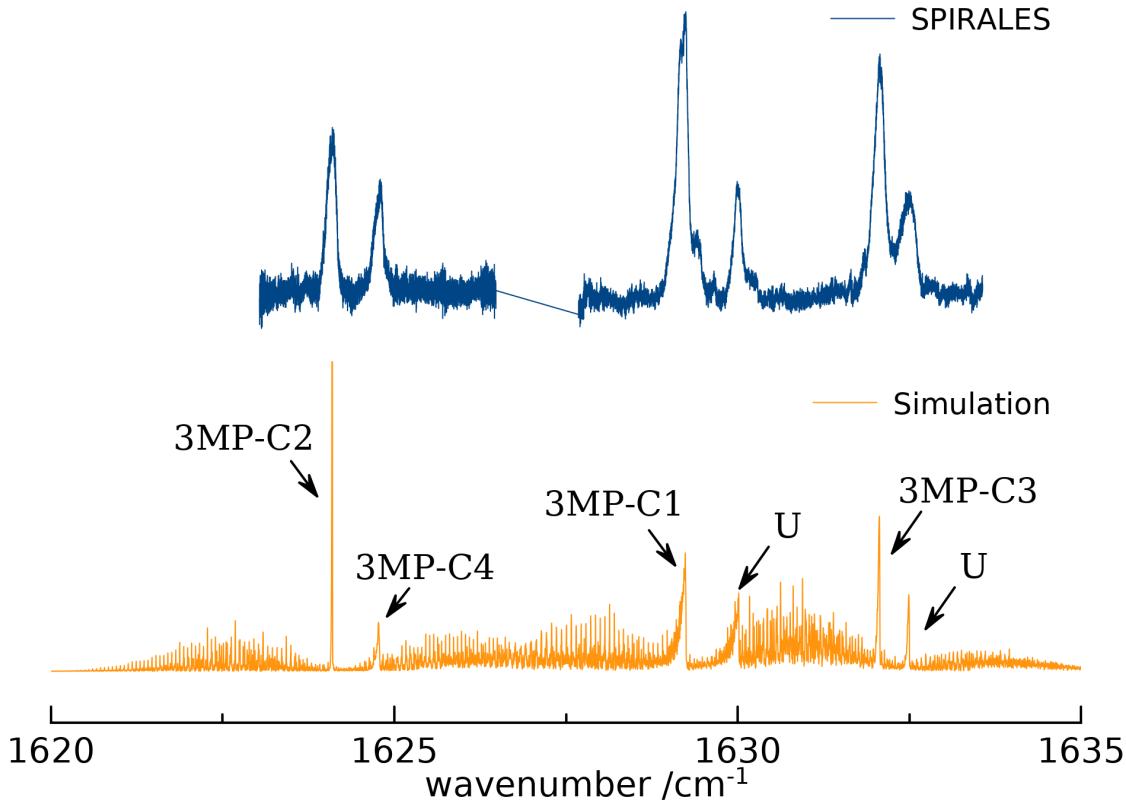

FIG. S3: SPIRALES spectrum of 3MP in the ν_{37} bands region and comparison with a simulation of the expected spectrum at high resolution using the parameters optimized for the ν_{18} band (30 K temperature and 0.004 cm^{-1} FWHM). Experimental ground state constants and scaled upper state constants of 3MP-C1 to 3MP-C4 have been used. Band centers of the four conformers were taken from the attribution of this work while their relative intensities is a function of their abundances. To reflect the high density of modes, the two bands non assigned in this work (indicated by a U), presumably hot bands, are also simulated using the spectroscopic parameters of the closest band in frequency. Despite the high density of lines, the rotational structure should have been resolved.

II. SUPPLEMENTARY TABLES

TABLE S1: B3LYP/cc-pVTZ calculations on 2MP-C1: Harmonic and anharmonic frequencies in cm^{-1} and intensities in km/mol , symmetry, excited state rotational constants in cm^{-1} . The designation of the mode is obtained with the GAUSSVIEW6 software.

TABLE S8: Scaling of the rotational constants of 3MP-C1 and 3MP-C4 and comparison with the experimental values. Each scaled constant is calculated as $B_{\text{US scaled}} = B_{\text{US calc}} \times B_{\text{GS exp}} / B_{\text{GS calc}}$ where US refers to the upper state ($v_{18} = 1$) and GS to the ground state ($v = 0$)

Conformer	Mode	type	<i>A</i>	<i>B</i>	<i>C</i>
3MP-C1	$v = 0$	Calc.	0.094877	0.043397	0.029994
		Exp.	0.094762	0.043481	0.029987
	$v_{18} = 1$	Calc.	0.094864	0.042886	0.029698
		Scaled	0.094749	0.042969	0.029691
		Exp.	0.094742	0.043390	0.029958
	3MP-C4	Calc.	0.095095	0.042760	0.029674
		Exp.	0.094968	0.043301	0.029923
		Calc.	0.095090	0.042700	0.029632
		Scaled	0.094963	0.043240	0.029881
		Exp.	0.094920	0.043209	0.029890

TABLE S9: Assigned transitions in the v_{18} band of 3MP-C1, experimental frequencies, uncertainties, and weight of each component (calculated at 30 K). $v' = 1$ refers to $v_{18} = 1$ and $v'' = 0$ to the vibrational ground state.
